

### FEATURES

**Ultralow offset voltage**

$T_A = 25^\circ\text{C}$ ,  $25 \mu\text{V}$  maximum

**Outstanding offset voltage drift**  $0.1 \mu\text{V}/^\circ\text{C}$  maximum

**Excellent open-loop gain and gain linearity**

12 V/ $\mu\text{V}$  typical

**CMRR:** 130 dB minimum

**PSRR:** 115 dB minimum

**Low supply current** 2.0 mA maximum

**Fits industry-standard precision op amp sockets**

### GENERAL DESCRIPTION

The OP177 features one of the highest precision performance of any op amp currently available. Offset voltage of the OP177 is only  $25 \mu\text{V}$  maximum at room temperature. The ultralow  $V_{OS}$  of the OP177 combines with its exceptional offset voltage drift ( $TCV_{OS}$ ) of  $0.1 \mu\text{V}/^\circ\text{C}$  maximum to eliminate the need for external  $V_{OS}$  adjustment and increases system accuracy over temperature.

The OP177 open-loop gain of  $12 \text{ V}/\mu\text{V}$  is maintained over the full  $\pm 10 \text{ V}$  output range. CMRR of 130 dB minimum, PSRR of 120 dB minimum, and maximum supply current of 2 mA are just a few examples of the excellent performance of this

### PIN CONFIGURATION

Figure 1. 8-Lead PDIP (P-Suffix),  
8-Lead SOIC (S-Suffix)

operational amplifier. The combination of outstanding specifications of the OP177 ensures accurate performance in high closed-loop gain applications.

This low noise, bipolar input op amp is also a cost effective alternative to chopper-stabilized amplifiers. The OP177 provides chopper-type performance without the usual problems of high noise, low frequency chopper spikes, large physical size, limited common-mode input voltage range, and bulky external storage capacitors.

The OP177 is offered in the  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$  extended industrial temperature ranges. This product is available in 8-lead PDIP, as well as the space saving 8-lead SOIC.

OFFSET ADJUSTMENT RANGE		$R_P = 20 \text{ k}\Omega$		$\pm 3$			$\pm 3$		mV

<sup>1</sup> Long-term input offset voltage stability refers to the averaged trend line of  $V_{os}$  vs. time over extended periods after the first 30 days of operation. Excluding the initial hour of operation, changes in  $V_{os}$  during the first 30 operating days are typically less than 2.0  $\mu\text{V}$ .

<sup>2</sup> Sample tested.

<sup>3</sup> Guaranteed by design.

<sup>4</sup> Guaranteed by CMRR test condition.

<sup>5</sup> To ensure high open-loop gain throughout the  $\pm 10 \text{ V}$  output range,  $A_{vo}$  is tested at  $-10 \text{ V} \leq V_o \leq 0 \text{ V}, 0 \text{ V} \leq V_o \leq +10 \text{ V}$ , and  $-10 \text{ V} \leq V_o \leq +10 \text{ V}$ .

# OP177

@  $V_S = \pm 15$  V,  $-40^\circ\text{C} \leq T_A \leq +85^\circ\text{C}$ , unless otherwise noted.

**Table 2.**

Parameter	Symbol	Conditions	OP177F	OP177G	Unit
			Min	Typ	Max
INPUT					
Input Offset Voltage	$V_{OS}$		15	40	20 100 $\mu\text{V}$
Average Input Offset Voltage Drift <sup>1</sup>	$TCV_{OS}$		0.1	0.3	0.7 1.2 $\mu\text{V}/^\circ\text{C}$
Input Offset Current	$I_{OS}$		0.5	2.2	0.5 4.5 nA
Average Input Offset Current Drift <sup>2</sup>	$TCI_{OS}$		1.5	40	1.5 85 pA/ $^\circ\text{C}$
Input Bias Current	$I_B$		-0.2	+2.4	+4 +2.4 $\pm 6$ nA
Average Input Bias Current Drift <sup>2</sup>	$TCI_B$		8	40	15 60 pA/ $^\circ\text{C}$
Input Voltage Range <sup>3</sup>	$IVR$		$\pm 13$	$\pm 13.5$	$\pm 13$ $\pm 13.5$ V
COMMON-MODE REJECTION RATIO	CMRR	$V_{CM} = \pm 13$ V	120	140	dB
POWER SUPPLY REJECTION RATIO	PSRR	$V_S = \pm 3$ V to $\pm 18$ V	110	120	dB
LARGE-SIGNAL VOLTAGE GAIN <sup>4</sup>	$A_{VO}$	$R_L \geq 2$ k $\Omega$ , $V_O = \pm 10$ V	2000	6000	V/mV
OUTPUT VOLTAGE SWING	$V_O$	$R_L \geq 2$ k $\Omega$	$\pm 12$	$\pm 13$	V
POWER CONSUMPTION	$P_D$	$V_S = \pm 15$ V, no load	60	75	mW
SUPPLY CURRENT	$I_{SV}$	$V_S = \pm 15$ V, no load	20	2.5	mA

<sup>1</sup>  $TCV_{OS}$  is sample tested.

<sup>2</sup> Guaranteed by endpoint limits.

<sup>3</sup> Guaranteed by CMRR test condition.

<sup>4</sup> To ensure high open-loop gain throughout the  $\pm 10$  V output range,  $A_{VO}$  is tested at  $-10$  V  $\leq V_O \leq 0$  V,  $0$  V  $\leq V_O \leq +10$  V, and  $-10$  V  $\leq V_O \leq +10$  V.

## TEST CIRCUITS

Figure 3. Typical Offset Voltage Test Circuit

Figure 4. Optional Offset Nulling Circuit

Figure 5. Burn-In Circuit

## ABSOLUTE MAXIMUM RATINGS

Table 3.

Parameter	Ratings
Supply Voltage	$\pm 22\text{ V}$
Internal Power Dissipation <sup>1</sup>	500 mW
Differential Input Voltage	$\pm 30\text{ V}$
Input Voltage	$\pm 22\text{ V}$
Output Short-Circuit Duration	Indefinite
Storage Temperature Range	$-65^\circ\text{C}$ to $+125^\circ\text{C}$
Operating Temperature Range	$-40^\circ\text{C}$ to $+85^\circ\text{C}$
Lead Temperature (Soldering, 60 sec)	300°C
DICE Junction Temperature ( $T_j$ )	$-65^\circ\text{C}$ to $+150^\circ\text{C}$

<sup>1</sup> For supply voltages less than  $\pm 22\text{ V}$ , the absolute maximum input voltage is equal to the supply voltage.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## THERMAL RESISTANCE

$\theta_{JA}$  is specified for worst-case mounting conditions, that is,  $\theta_{JA}$  is specified for device in socket for PDIP;  $\theta_{JA}$  is specified for device soldered to printed circuit board for SOIC package.

Table 4. Thermal Resistance

Package Type	$\theta_{JA}$	$\theta_{JC}$	Unit
8-Lead PDIP (P-Suffix)	103	43	°C/W
8-Lead SOIC (S-Suffix)	158	43	°C/W

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## APPLICATION INFORMATION

### GAIN LINEARITY

The actual open-loop gain of most monolithic op amps varies at different output voltages. This nonlinearity causes errors in high closed-loop gain circuits.

It is important to know that the manufacturer's Avo specification is only a part of the solution because all automated testers use endpoint testing and, therefore, show only the average gain. For example, Figure 23 shows a typical precision op amp with a respectable open-loop gain of 650 V/mV. However, the gain is not constant through the output voltage range, causing nonlinear errors. An ideal op amp shows a horizontal scope trace.

Figure 24 shows the OP177 output gain linearity trace with its truly impressive average Avo of 12,000 V/mV. The output trace is virtually horizontal at all points, assuring extremely high gain accuracy. Analog Devices also performs additional testing to ensure consistent high open-loop gain at various output voltages. Figure 25 is a simple open-loop gain test circuit.

Figure 23. Typical Precision Op Amp

Figure 24. Output Gain Linearity Trace

Figure 25. Open-Loop Gain Linearity Test Circuit

### THERMOCOUPLE AMPLIFIER WITH COLD-JUNCTION COMPENSATION

An example of a precision circuit is a thermocouple amplifier that must accurately amplify very low level signals without introducing linearity and offset errors to the circuit. In this circuit, an S-type thermocouple with a Seebeck coefficient of  $10.3 \mu\text{V}/^\circ\text{C}$  produces  $10.3 \text{ mV}$  of output voltage at a temperature of  $1000^\circ\text{C}$ . The amplifier gain is set at 973.16, thus, it produces an output voltage of  $10.024 \text{ V}$ . Extended temperature ranges beyond  $1500^\circ\text{C}$  are accomplished by reducing the amplifier gain. The circuit uses a low cost diode to sense the temperature at the terminating junctions and, in turn, compensates for any ambient temperature change. The OP177, with its high open-loop gain plus low offset voltage and drift, combines to yield a precise temperature sensing circuit. Circuit values for other thermocouple types are listed in Table 5.

Table 5.

Thermocouple Type	Seebeck Coefficient	R1	R2	R7	R9
K	$39.2 \mu\text{V}/^\circ\text{C}$	$110 \Omega$	$5.76 \text{ k}\Omega$	$102 \text{ k}\Omega$	$269 \text{ k}\Omega$
J	$50.2 \mu\text{V}/^\circ\text{C}$	$100 \Omega$	$4.02 \text{ k}\Omega$	$80.6 \text{ k}\Omega$	$200 \text{ k}\Omega$
S	$10.3 \mu\text{V}/^\circ\text{C}$	$100 \Omega$	$20.5 \text{ k}\Omega$	$392 \text{ k}\Omega$	$1.07 \text{ M}\Omega$

Figure 26. Thermocouple Amplifier with Cold Junction Compensation

## PRECISION HIGH GAIN DIFFERENTIAL AMPLIFIER

The high gain, gain linearity, CMRR, and low TCV<sub>os</sub> of the OP177 make it possible to obtain performance not previously available in single stage, very high gain amplifier applications. See Figure 27.

For best CMR,  $\frac{R1}{R2}$  must equal  $\frac{R3}{R4}$

In this example, with a 10 mV differential signal, the maximum errors are listed in Table 6.

Figure 27. Precision High Gain Differential Amplifier

Table 6. High Gain Differential Amp Performance

Type	Amount
Common-Mode Voltage	0.1%/V
Gain Linearity, Worst Case	0.02%
TCV <sub>os</sub>	0.0003%/°C
TCI <sub>os</sub>	0.008%/°C

## ISOLATING LARGE CAPACITIVE LOADS

The circuit shown in Figure 28 reduces maximum slew rate but allows driving capacitive loads of any size without instability. Because the 100 Ω resistor is inside the feedback loop, its effect on output impedance is reduced to insignificance by the high open loop gain of the OP177.

Figure 28. Isolating Capacitive Loads

## BILATERAL CURRENT SOURCE

The current sources shown in Figure 29 supply both positive and negative currents into a grounded load.

Note that

$$Z_o = \frac{R5 \left( \frac{R4}{R2} + 1 \right)}{\frac{R5 + R4}{R2} - \frac{R3}{R1}}$$

and that for Z<sub>o</sub> to be infinite

$$\frac{R5 + R4}{R2} \text{ must} = \frac{R3}{R1}$$

## PRECISION ABSOLUTE VALUE AMPLIFIER

The high gain and low TCV<sub>os</sub> assure accurate operation with inputs from microvolts to volts. In this circuit, the signal always appears as a common-mode signal to the op amps (for details, see Figure 30).

Figure 29. Bilateral Current Source

Figure 30. Precision Absolute Value Amplifier

Figure 31. Precision Positive Peak Detector

**PRECISION POSITIVE PEAK DETECTOR**

In Figure 31,  $C_H$  must be polystyrene, Teflon®, or polyethylene to minimize dielectric absorption and leakage. The droop rate is determined by the size of  $C_H$  and the bias current of the AD820.

**PRECISION THRESHOLD DETECTOR/AMPLIFIER**

In Figure 32, when  $V_{IN} < V_{TH}$ , amplifier output swings negative, reverse biasing diode  $D_1$ .  $V_{OUT} = V_{TH}$  if  $R_L = \infty$ . When  $V_{IN} \geq V_{TH}$ , the loop closes.

$$V_{OUT} = V_{TH} + (V_{IN} - V_{TH}) \left( 1 + \frac{R_F}{R_S} \right)$$

$C_C$  is selected to smooth the response of the loop.

Figure 32. Precision Threshold Detector/Amplifier
